## Technical information

°BRIX

RESISTENCE

UNIFORMITY

Indeterminate-growth cocktail-type table tomato variety for greenhouse cultivation. The bunch is arranged in a heringbone pattern of 10-12 fruits of 35-40 g each, with an intense red color. The rachis is very thick and gives the bunch elegance and compactness, as well as having a long persistence over time that always gives freshness to the bunch. The fruits have high resistance both on the plant (it does not split and it does not present blotchy) and post-harvest as well (Long Shelf Life at the highest market levels) They have an intense red colour, excellent flavour and a sugar content usually above 6°Brix.. The plant is very rustic, strong, covering and with short internodes. It resists high temperatures and it's adapt to different types of soil as well.
